HOW TO MEASURE FOR METAL CEILINGS.

First take the actual dimensions of room in feet and inches, then add to each dimension twice the depth of the Cornice to be used. Add to this 4 inches for variation. For example, take a room the measurements of which are 15 feet, 0 inches by 39 feet, 0 inches.

If your Cornice extends down on the wall 12 inches, add 24 inches to each dimension, and then add 4 inches for variation to each dimension, which is tabulated as follows:

Size of Room	15 ft. 0 in. x 39 ft. 0 in.
Cornice	2 ft. 0 in. x 2 ft. 0 in.
For variation	0 ft. 4 in. x 0 ft. 4 in.
Total	17 ft. 4 in. x 41 ft. 4 in.

We now have the dimensions, 17 ft., 4 in. by 41 ft. 4 in.: multiplied, gives the actual number of square feet of metal in the entire ceiling, cornice, etc., namely 716 square feet.

The deeper the cornice, the greater the cost of the material. The selection of its depth should be governed by the height of ceiling. For a room 12 feet high the depth of plate must be considered in making a selection of designs. After the selection has been made and price agreed upon, multiply the cost of the metal by the square feet in the ceiling. To this must be added the cost of labor for erecting.
